Information Systems Research

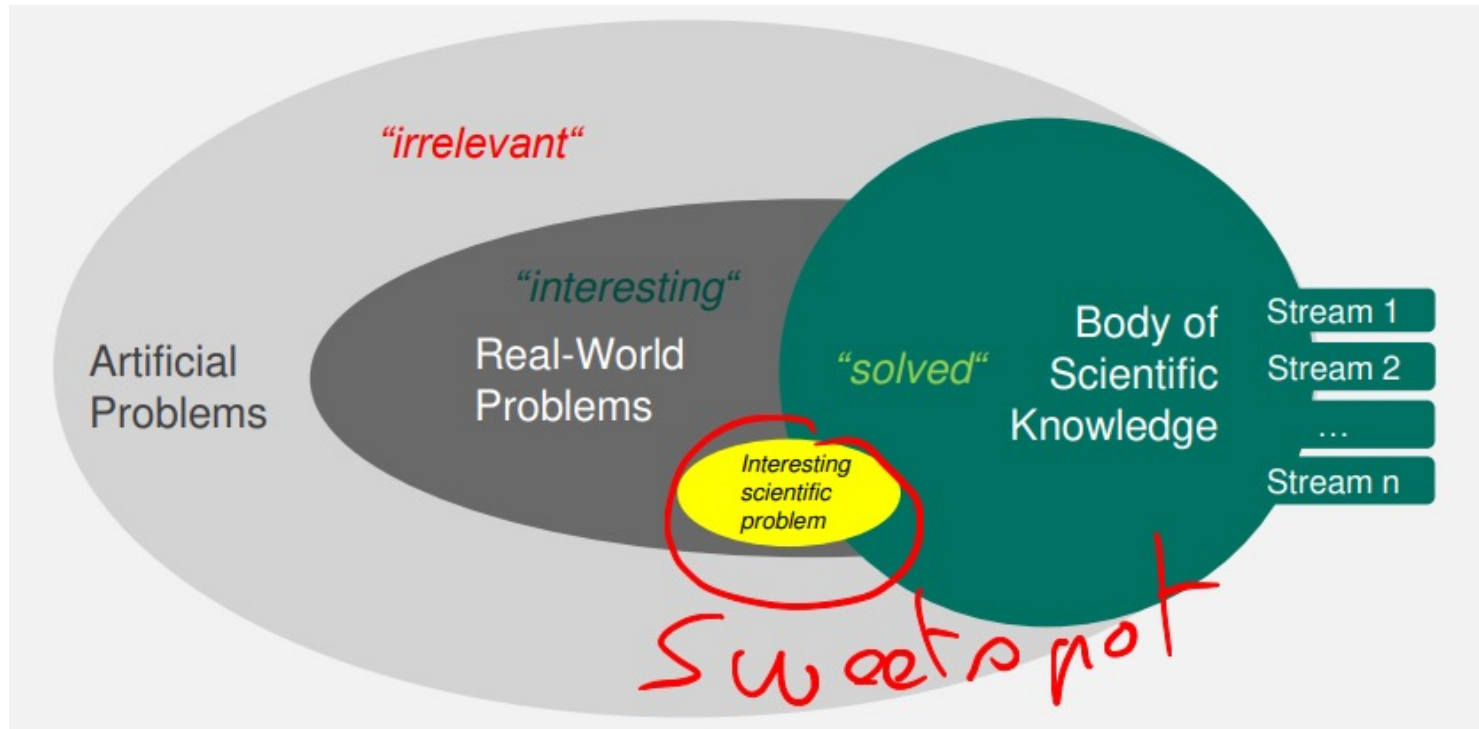

Must respond to a dual mission:

1. Make a theoretical contribution
2. Assist in solving current and anticipated problems of practitioners

Design Science Research

- Design science research is a research paradigm in which a designer answers questions relevant for human problems via the creation of innovative **artifacts**, thereby contributing new knowledge to the body of scientific evidence.

Design Science Approach

- Construction-oriented view of IS research.
- Centered around designing and building innovative *IT artifacts*.
- Provides a schema to do research, while providing knowledge relevant for practitioners.

Artifact?

Material and organizational features
that are socially recognized as bundles of hardware
and/or
software.

e.g. Algorithms, human-computer interfaces,
methodologies, design principles ...

Guidelines

- 
- 1 Design as an Artifact**
 - 2 Problem Relevance**
 - 3 Design Evaluation**
 - 4 Research Contributions**
 - 5 Communication of Research**

1 Design as an Artifact

Design-science research must produce a viable artifact in the form of a construct, a model, a method or an instantiation.

2 Problem Relevance

The objective of design-science research is to develop technology-based solutions to important and relevant business problems.

3 Design Evaluation

The utility, quality, and efficacy of a design artifact must be rigorously demonstrated via well-executed evaluation methods.

Evaluation Methods I

Observational

Case Study
Field Study

Analytical

Statistical
Architectural
Optimization
Dynamic

Experimental

Controlled Experiment
Simulation

Evaluation Methods II

Testing

Functional (Black Box)
Structural (White Box)

Descriptive

Informed Argument
Scenarios

Evaluation Methods:

Table 2. Design Evaluation Methods

1. Observational	Case Study: Study artifact in depth in business environment
	Field Study: Monitor use of artifact in multiple projects
2. Analytical	Static Analysis: Examine structure of artifact for static qualities (e.g., complexity)
	Architecture Analysis: Study fit of artifact into technical IS architecture
	Optimization: Demonstrate inherent optimal properties of artifact or provide optimality bounds on artifact behavior
	Dynamic Analysis: Study artifact in use for dynamic qualities (e.g., performance)
3. Experimental	Controlled Experiment: Study artifact in controlled environment for qualities (e.g., usability)
	Simulation – Execute artifact with artificial data
4. Testing	Functional (Black Box) Testing: Execute artifact interfaces to discover failures and identify defects
	Structural (White Box) Testing: Perform coverage testing of some metric (e.g., execution paths) in the artifact implementation
5. Descriptive	Informed Argument: Use information from the knowledge base (e.g., relevant research) to build a convincing argument for the artifact's utility
	Scenarios: Construct detailed scenarios around the artifact to demonstrate its utility

Discount Usability

- Defined by Nielsen Norman Group
- Simple user testing with **5 participants**, paper prototyping, and heuristic evaluation offer a cheap, fast, and early focus on usability, as well as many rounds of iterative design.

5 participants but the right ones!

<https://www.nngroup.com/articles/discount-usability-20-years/>

<https://www.nngroup.com/articles/why-you-only-need-to-test-with-5-users/>

4 Research Contributions

Effective design-science research must provide clear and verifiable contributions in the areas of the design artifact, design foundations, and/or design methodologies.

1

Artifact Itself

2

Development of the Artifact

3

Evaluation

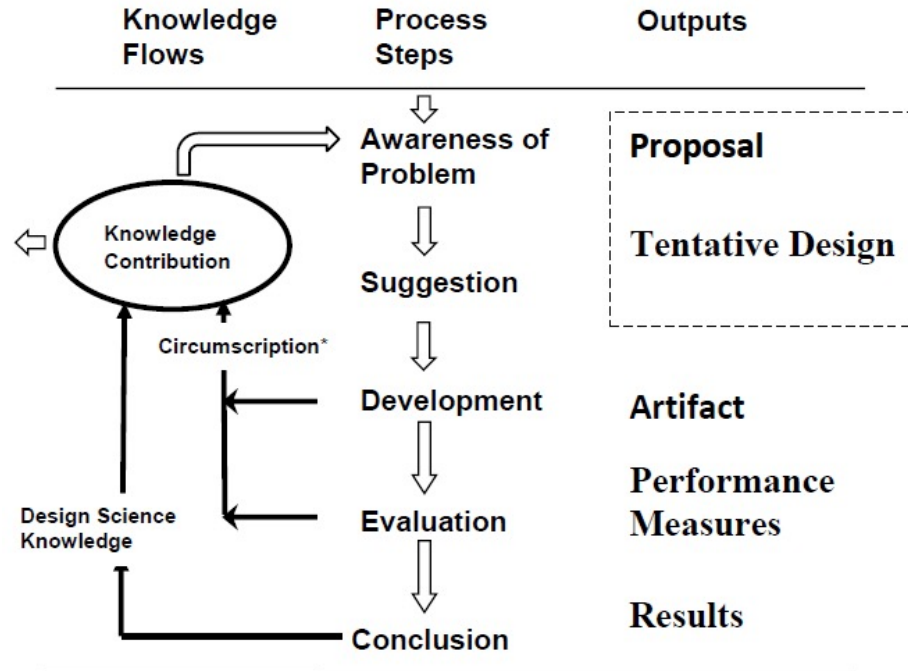

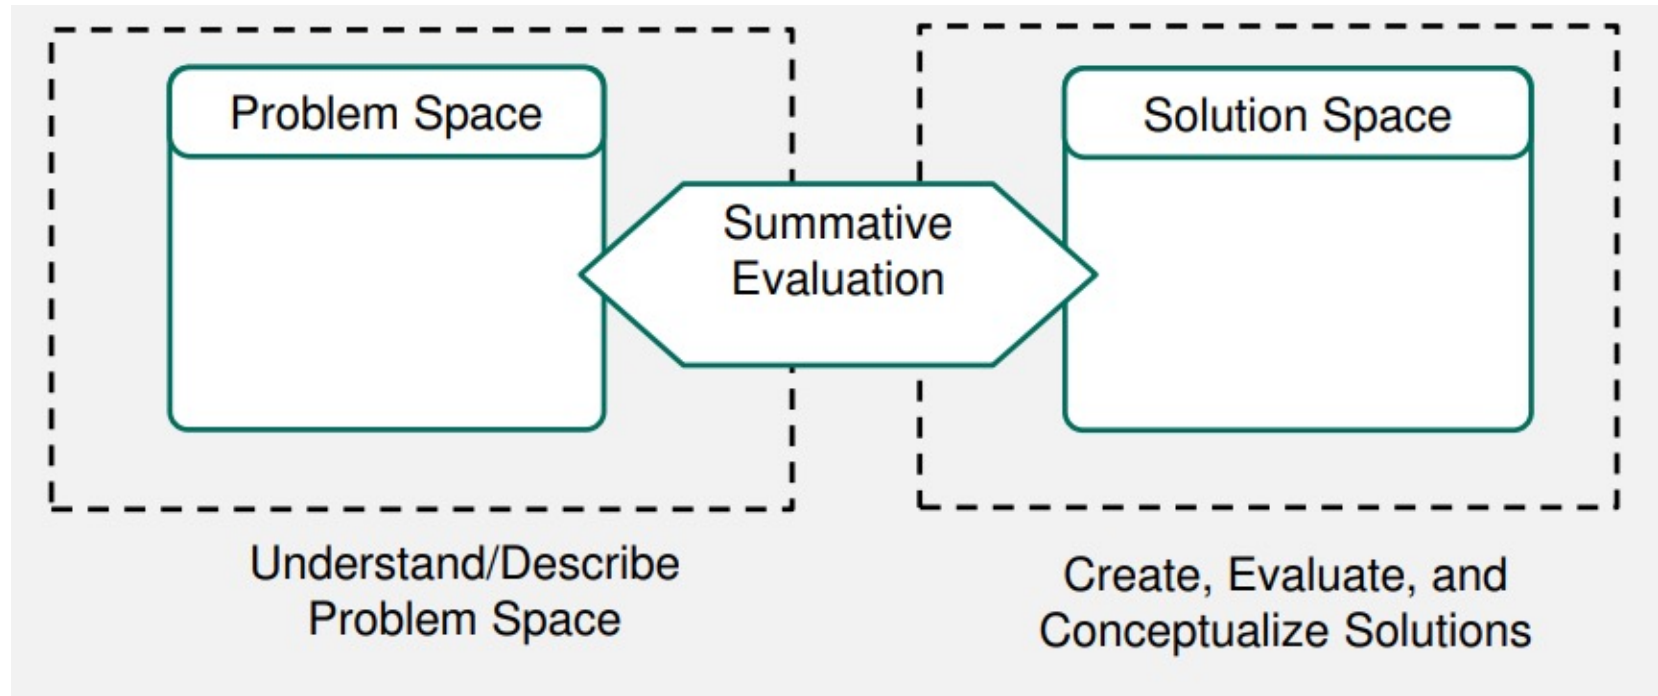

5 Communication of Research

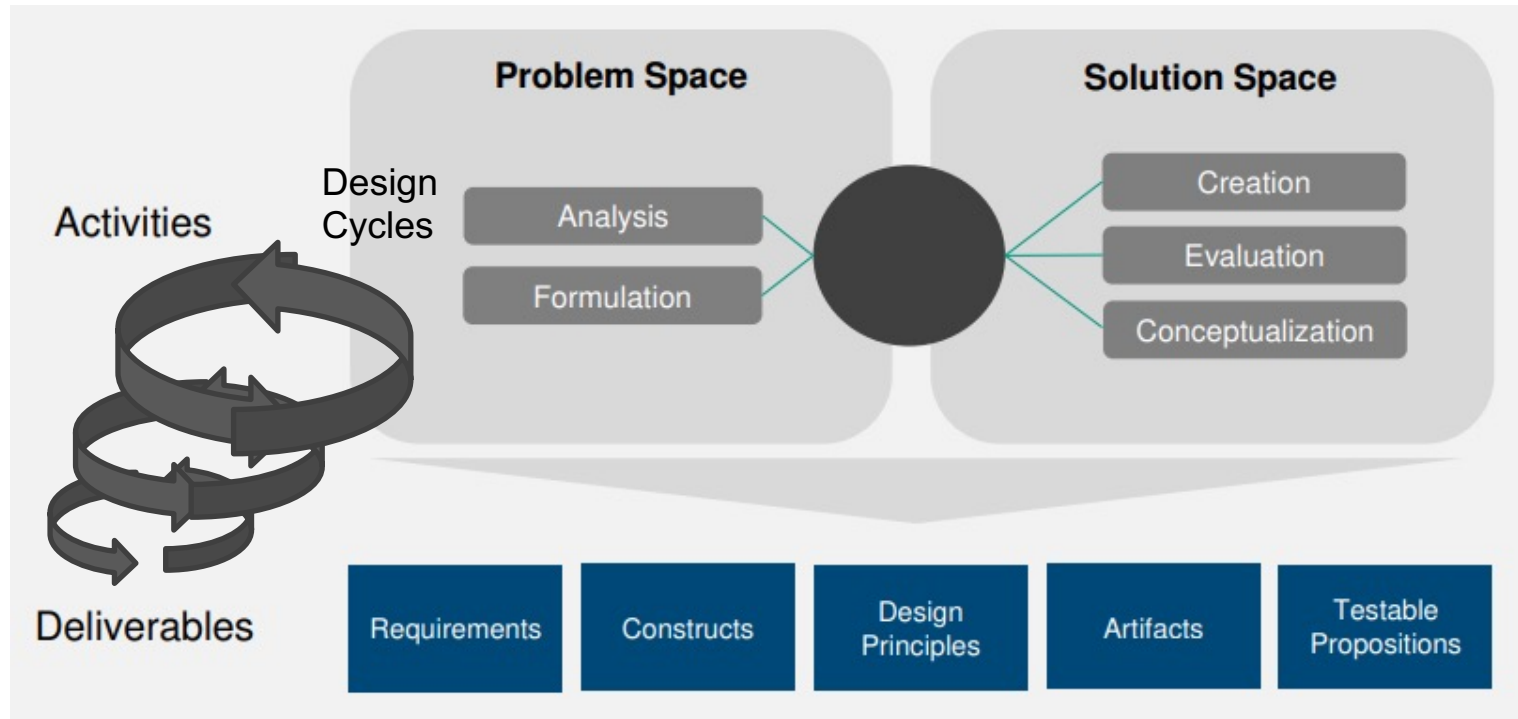

Design-science research must be presented effectively both to technology-oriented as well as management-oriented audiences.

DS Research Process Model (Cycle)

Instantiation of the Artifact

- Sketches & Wireframes
- Prototype
 - From scratch
 - No/Low-Code Development
