

1.5 Question 5

1.5.A Find $\gcd(85327, 59840)$.

$a = 85327, b = 59840$			
\Rightarrow	$85327 \div 59840$	$=$	$1 \text{ R } 25487$
SWITCH: $a = b, b = R$			
$a = 59840, b = 25487$			
\Rightarrow	$59840 \div 25487$	$=$	$2 \text{ R } 8866$
SWITCH: $a = b, b = R$			
$a = 25487, b = 8866$			
\Rightarrow	$25487 \div 8866$	$=$	$2 \text{ R } 7755$
SWITCH: $a = b, b = R$			
$a = 8866, b = 7755$			
\Rightarrow	$8866 \div 7755$	$=$	$1 \text{ R } 1111$
SWITCH: $a = b, b = R$			
$a = 7755, b = 1111$			
\Rightarrow	$7755 \div 1111$	$=$	$6 \text{ R } 1089$
SWITCH: $a = b, b = R$			
$a = 1111, b = 1089$			
\Rightarrow	$1111 \div 1089$	$=$	$1 \text{ R } 22$
SWITCH: $a = b, b = R$			
$a = 1089, b = 22$			
\Rightarrow	$1089 \div 22$	$=$	$49 \text{ R } 11$
SWITCH: $a = b, b = R$			
$a = 22, b = 11$			
\Rightarrow	$22 \div 11$	$=$	$2 \text{ R } 0$

1.5.B Are numbers in A relative prime? Justify your answer.

No, they are not because 11 is their greatest common divisor.

$$85327 \div 11 = 7757$$

$$59840 \div 11 = 5440$$

1.5.C Using Fermat's theorem find $4^{225} \bmod 13$

We know from FERMAT'S LITTLE THEOREM that :

$$4^{12} \equiv 1 \pmod{13}$$

Furthermore from the rules of modulo-arithmetic, we know:

<i>if</i>	$a \equiv b \pmod{n} \text{ and } c \equiv d \pmod{n}$
<i>then</i>	$ac \equiv bd \pmod{n}$

Therefore we know that:

$$4^{216} \equiv 1 \pmod{13}$$

Because:

$$4^9 = 262.144 \equiv 12 \pmod{13}$$

Our result would be:

$$4^{225} \pmod{13} = 12$$

1.5.D Using the Miller-Rabin test, say whether $n=104717$ is probably prime.

Find k and q :

$$n - 1 = 104716 = 2^2 \times 26179 = 2^k \times q$$

RNG for a : $a = 10$

$$10^{26179} \pmod{104716} = 77440$$

$$(10^{26179})^2 \pmod{104716} = 77712$$

\Rightarrow Test return composite!

Therefore 104717 is not a prime!

1.5.E Compute the set of integers that solve the equation $3^k \equiv 12 \pmod{23}$ for k .

We know from the rules of modulo-arithmetic:

$$\begin{array}{ll} \text{if} & a \equiv b \pmod{n} \text{ and } c \equiv d \pmod{n} \\ \text{then} & ac \equiv bd \pmod{n} \end{array}$$

Furthermore we know (because 23 is prime) that:

$$3^{22} \equiv 1 \pmod{23}$$

Therefore we need to find j :

$$3^j \equiv 12 \pmod{23}, 0 < j < 22$$

This is the case for $j = 4$ and $j = 15$. Hence, the set of integers, that solve this equation would be:

$$S = \{k \mid k = a \times 22 + j, a \in \mathbb{N}, j \in \{4, 15\}\}$$
